Cafe Crema Italia

An authentic Italian bar (*caffè*) in Dunedin, Florida, pouring Crema Italia coffee, selling locally sourced baked goods, and turning to light beer and wine in the early evening. Roughly 7am to 8pm, one lease and one staff base across three dayparts. Managed and co-owned by Anastasia Galperin. **Nothing here is decided** - this puts the concept, its modelled economics and its open ends in one place.

Crema Italia, LLC converts to a **Delaware C-Corp at investment close** - already committed in Investor Deck v1, not a hypothetical. The proposal is that the parent holds shares in a **second C-Corp** operating the café, alongside Anastasia Galperin as co-owner and operator, buying coffee under an ordinary commercial agreement and licensing the name.

Why it may be worth doing

- **The most visible use of the mark.** A physical room where the brand is experienced rather than described, and the strongest available answer to a storefront that cannot yet show photography of anything - and a second demand curve on the same landed inventory.
- **The Italian-bar format is throughput-bound, not seat-bound.** Stand at the counter, order, leave. The single most important economic feature of the concept: revenue is not capped by square footage the way a seated café's is, and dayparting spreads one rent and one team across morning espresso, midday food and an evening beer and wine trade.

Modelled economics - the day-only concept

From *CCIB_MonteCarlo.xlsx* (v2), 1,000 trials per footprint. The model predates the evening trade and assumes a **7am-3pm** day, so all three scenarios below are coffee and food only. Rent $26/sq ft/yr NNN, COGS 27-30%, labour $15/hr plus 20% burden.

Scenario	Footprint	Mean profit	Downside (10th pct)	P(profit > 0)	P(> $40k)	Break-even covers/day
Small counter-only	900 sq ft, 20 seats	-$12,300	-$37,700	26%	1%	82
Target mid-range	1,200 sq ft, 28 seats	+$19,700	-$22,100	72%	25%	104
Large expanded seating	1,800 sq ft, 49 seats	+$76,900	+$1,600	90%	73%	142

The day-only business is marginal at the sizes under consideration. Target returns a mean of $19,700, clears the $40,000 threshold in only one year in four, and carries a -$22,100 downside. The model's own remedy is *size*: Large is the only scenario whose 10th percentile stays profitable, because counter throughput scales with staff rather than seats. But size is the only growth lever the model contains, and it flatters Large - build-out capital is unmodelled and scales with square footage.

The profitability case is the part with no numbers behind it

Extending to 8pm and adding an early-evening beer and wine trade is **new, deliberate, and considered necessary for profitability**. It is the answer to the marginal day-only economics above, not an oversight in the model - the model simply predates it. It is also **entirely uncosted**: no revenue, no COGS, no licence, no incremental insurance, and no labour for the extra hours, a 7am-8pm day being roughly **91 hrs/week against the model's 56**. So **the case for the café now rests on the one daypart that has never been modelled.** Sizing it comes before a lease, because the evening trade also determines footprint and fit-out.

Other gaps and unsettled inputs

- **Footprint is not settled. 800-1,200 sq ft** is a hypothetical range rather than a plan; the model's Target column sits at 1,200 while its own note says ~700-800. Footprint moves rent, seats and labour together, so it should follow the evening-trade sizing rather than precede it.
- **Build-out and leasehold improvement** are excluded by design, as are financing costs and seasonality. No capital requirement has been costed.
- **The COGS tab is empty**, so 27-30% is asserted rather than built up from a coffee, pastry and alcohol mix - and alcohol carries a different margin from either.
- **Transfer pricing.** Related-party sales between two entities under common control must be defensible at arm's length, and the café's true profitability is only visible once that price is honest.

Open questions

- **Does the café conflict with what investors were told?** Investor Deck v1 lists "a café chain" among the things Crema Italia is *not*. One café is not a chain, but incoming shareholders would hold 12% of a parent whose capital is partly exposed to a restaurant venture. This is a disclosure question, not a positioning one.
- **Location has moved.** The earlier written record placed the café in **Tampa**; the model and the current concept say **Dunedin**. Dunedin is taken as current here.
- **Do the roaster agreements permit on-premise pouring and resale?** No roaster has been asked, and it belongs in the agreement rather than being discovered afterwards. It is the same upstream question that gates the wholesale channel.
- **Name licence.** Crema Italia™ is unregistered, and the café would be the mark's most visible use. Licensing an unregistered mark to a separate entity carries a trademark trap already identified in the wholesale brief.

> **Every number here is provisional.** The model's own read-me says there is no reliable published statistic for the dine-in versus walk-in split at small independent cafés, so its inputs use defensible mechanisms rather than observed data. Each figure is a planning placeholder awaiting real quotes, a real lease and real POS history, and no capital requirement has been costed at all. Start with the evening trade: it is the smallest piece of modelling left and the one the answer turns on.
